

# Why choose MeterMate?

MeterMate data logging systems offer distinct advantages over many “similar” systems including:

- **“Plug & Play” set up** - no onsite programming of data loggers required which simplifies the set-up process
- **Remote programming** - the option to alter the data logger settings (e.g. report frequency, log interval, pulse ratio etc) remotely from your PC
- **Fast data access and analysis** - unique data handling & management techniques allow interrogation of data at faster rates than most similar services, making the user experience smoother and less frustrating
- **Range of data provision/hosting options** - web-based data access on the MeterMate website or automated delivery of raw data to an existing building management system (BMS), SCADA network, client website etc
- **Customised reports and interfaces**—a range of standard user-interface templates and reports are available, however customised interfaces with specific features can be developed
- **Flexible (and low!) power requirement** - any 5-20 VDC power supply can be used including solar panels, mains electricity and a wide variety of battery packs
- **Range of log-in options** - multiple log-ins can be set for individuals and/or groups to control access to data from multiple sources
- **Range of data inputs supported** - including pulse, digital, 4-20mA, RS232, RS485, MODBUS, 0-5V
